A significant number of nonenhancing (NE) gliomas are reported to be malignant. The purpose of this study was to compare the value of advanced MR imaging techniques, including T2\*-dynamic susceptibility contrast PWI (DSC-PWI) and proton magnetic resonance spectroscopy (1 HMRS) in the evaluation of NE gliomas. Twenty

Introduction . Advanced MR imaging techniques have become an integral part of the evaluation of patients with brain tumors. Although structural imaging provides the primary foundation of an MR examination, advanced MR imaging techniques can potentially provide valuable insight into the physiology, histology, genetics, hemodynamics, and chemistry of a patient's tumor and brain.
