/ Edition 2 by ...

Abstract. Antiepileptic drugs (AEDs) are used extensively to treat multiple non-epilepsy disorders, both in neurology and psychiatry. This article provides a review of the clinical efficacy of AEDs in non-epilepsy disorders based on recently published preclinical and clinical studies, and attempts to relate this efficacy to the mechanism of action of AEDs and pathophysiological processes associated with the disorders.

Promising new antiepileptic agents are on the horizon. For the most part, these are orphan drugs or repurposed older agents that were belatedly found to have previously unrecognized antiseizure effects. Some of these investigational antiepileptic drugs (AEDs) may even be disease-modifying agents. In Bangkok, at the recent International Epilepsy Congress sponsored by the International League Against Epilepsy, J. Helen Cross, MD, OBE, highlighted several drugs in the developmental pipeline ...

drugs (AEDs) used to treat seizure disorders are today among the most common medications for which clinical laboratories perform therapeutic drug monitoring (TDM) (1, 2). The first-generation of AEDs—carbamazepine, ethosuximide, phenobarbital, phenytoin, primidone, and valproic acid—were introduced by U.S. and European drug manufacturers several decades ago, and TDM quickly became part of using them in clinical practice.
