An Overview of Gas Flow Measurement

In the world of gas flow measurement, there are multiple technologies available, including:
Thermal flow meters;
Differential pressure flow meters;
Ultrasonic flow meters;
Coriolis flow meters;
Mechanical flow meters;
These technologies cover all ranges of gas flow applications, including:
Research, Product Design,

Gas Flow Meters | Flow Meters by Application

Flow measurement is the quantification of bulk fluid movement. Flow can be measured in a variety of ways. The common types of flowmeters with industrial applications are listed below:

- a) Obstruction type (differential pressure or variable area)
- b) Inferential (turbine type)
- c) Electromagnetic

After that, the required flow measurement accuracy is determined. Typically accuracy is specified in percentage of actual reading (AR), in the percentage of calibrated span (CS), or in the percentage of full scale (FS) units. The accuracy requirements should be separately stated at minimum, normal, and maximum flowrates.

Available from 25mm up to 600mm bore to handle flow rates from 2.5 m³/hr up to 2500 m³/hr. Small bore sizes are manufactured in anodised aluminium, whilst larger units are available in ductile iron or carbon steel. The gas flow meters have a battery powered LCD which can display flow rate and total.

Gas Flow Meters | Process Control Systems | Flowquip

A flow meter is a precision instrument that measures the rate of gas flow or (liquid flow) in a pipe. There are four main meter styles for

flow measurement. Positive displacement meters collect a fixed volume of fluid, then release and refill the gas or liquid. Then, tally how many times the capacity fills to determine the flow.

Gas Flow Measurement for oil / gas exploration and production

Gas mass flowmeters and controllers (thermal dispersion) are very accurate, because they have no moving parts and measure the mass of gas not volume. They are ideal for chemical line monitoring, purging instrument air lines, and filtration leading. Our gas mass flowmeters can handle a wide range of gases including nitrogen, oxygen and argon.

A flow meter (or flowmeter) is an instrument used to measure linear, nonlinear, volumetric or mass flow rate of a liquid or a gas. When choosing flow meters, one should consider such intangible factors as familiarity of plant personnel, their experience with calibration and maintenance, spare parts availability, and mean time between failure history, etc., at the particular plant site.
