An important collection of papers on automata theory, a branch of mathematical logic based on the hypothetical logic machines of Post and Turing, and particularly on Turing's finding that there is a universal automaton [i.e., one with an unlimited number of states] in the sense that it can calculate any sequence that any special automaton can, provided only that it receives the appropriate set of input orders (Goldstine, p. 274).

The Dartmouth Summer Research Project on Artificial Intelligence, held at Dartmouth College in 1956, is regarded as the official "birthplace" of AI. This article draws on unpublished archives to shed new light on the origins of the conference and the complex relationships between cybernetics, automata studies, and AI in the 1950s.

An organism or an automaton receives stimuli via its sensory receptor organs, and performs actions via its effector organs. To say that certain actions are a response to certain stimuli means, in the simplest case, that the actions are performed when and only when those stimuli occur.

Automata Studies. Shannon's interest in cybernetics helps us understand McCarthy's experience co-editing Automata Studies with Shannon in the early 1950s, which led directly to McCarthy organizing the 1956 Dartmouth conference. McCarthy, who had worked under Shannon at Bell Labs in the summer of 1952 after finishing his PhD in mathematics at Princeton, recalled that he considered Shannon's title for the proposed book to be too conservative and thus used the new term "artificial intelligence ...
