Transfer of embryos. In cattle, embryos are routinely transferred to the uterine horn. This is because nearly all embryos are recovered non-surgically from the uterus, and therefore should be returned to this site. Furthermore, it is much easier to transfer embryos to the uterus than to the oviduct.

Training manual for embryo transfer in cattle

Embryo transfer (ET) is the process of removing one or more embryos (fertilized eggs) from the reproductive tract of a donor female and transferring them to one or more recipient female. The entire process involves breeding a donor cow (usually by A.I.), flushing embryos

Embryo transfer requires two  
components: generating and then  
obtaining (flushing) the embryos from  
the donor female and transferring  
each embryo into a different female  
(recipient) which gestates and give  
birth to that fetus. These two  
components do not necessarily have

Embryo transfer procedures have  
been useful in the diagnosis,  
treatment and salvage of reproductive  
function in so-called infertile cows  
(25, 26, 27). Although it is  
recommended that the cause of the  
infertility not be of genetic origin, this  
is often difficult to determine.
