16 Outline of the book This book is concerned with the structure of cellular solids, with their properties, and with the way these properties are exploited in engineering design and in nat- ure. The structure of honeycombs and foams is described in Chapter 2. Chapter 3 summarizes the properties of the solid materials from which they are made.

### Cellular Solids: Structure and Properties - Lorna J ...

Generally speaking, cellular solids have relative densities which are less than about 0.3; most are much less – as low as 0.003. At first sight one might suppose that the cell size, too, should be an important parameter, and sometimes it is; but (as later chapters show) most mechanical and thermal properties depend only weakly on cell size.

The relationship between the structure and the properties of cellular solids made of natural materials and the properties of engineered materials including metals, ceramics and polymer has been summarized by Gibson and Ashby (1988). Porous materials can be categorized into closed porous and open porous structures.

### Cellular Solids 1: Structures, Properties and Engineering ...

Cellular Solids: Many materials have a cellular structure, with either a two-dimensional array of prismatic cells, as in a honeycomb, or a three-dimensional array of polyhedral cells, as in a foam. Engineering honeycombs and foams can now be made from nearly any material: polymers, metals, ceramics, glasses and composites, with pore sizes ranging from nanometers to millimeters.
