An Introduction to Missing Data in Clinical Trials. by Statistical Consultancy Team on Fri, Aug 16, 2019. The approach to missing data in clinical trials has evolved over the past twenty years, particularly regarding the view to incorporate missing data in our understanding of results. The problem of missing data is of particular importance due to it introducing bias and leading to a loss of power, inefficiencies and false positive findings (Type I Error).

Clinical Trials with Missing Data: A Guide for ...

The Prevention and Treatment of Missing Data in Clinical Trials concludes that a more principled approach to design and analysis in the presence of missing data is both needed and possible. Such an approach needs to focus on two critical elements: (1) careful design and conduct to limit the amount and impact of missing data and (2) analysis that makes full use of information on all randomized participants and is based on careful attention to the assumptions about the nature of the missing ...

The Prevention and Treatment of Missing Data in Clinical ...

This article summarizes recommendations on the design and conduct of clinical trials of a National Research Council study on missing data in clinical trials. Key findings of the study are that (a) substantial missing data is a serious problem that undermines the scientific credibility of causal conclusions from clinical trials; (b) the assumption that analysis methods can compensate for substantial missing data is not justified; hence (c) clinical trial design, including the choice of key ...

A major source of missing data in clinical trials is participants who discontinue the assigned treatment because of adverse events, lack of tolerability, lack of efficacy, or simple inconvenience.

The reason for missing data and handling of missing data in the analysis represent critical factors in the regulatory assessment of all confirmatory clinical trials. The main focus of this guideline is issues associated with the analysis of the primary efficacy endpoint where patients are followed up over time.

Guideline on Missing Data in Confirmatory Clinical Trials

In drug, device and behavioral clinical trials, patient withdrawal, loss-to-follow-up, and non-compliance with treatment protocols complicate analysis. When the data planned for collection are compromised or incomplete, estimates for treatment effect may be biased and trial conclusions may not be generalizable.

The Prevention and Treatment of Missing Data in Clinical ...

Since patients often drop out because they find a treatment doesn't seem to be working for them or because it causes harmful side effects, missing data is often correlated with the treatment's efficacy or safety. This type of selection bias makes a reliable assessment of a clinical trial's results particularly difficult. Methods to address missing data make assumptions about the relationship between dropout and study results in order to produce results which account for the missing data.

Nearly a third (n = 11; 32.4%) of the recent 34 clinical trial reports I read used static imputation, filling in the missing data with a "best guess." All but two assumed that the client had relapsed or returned to baseline levels of use. The remaining two used the last observation to fill in the missing data on subsequent assessments.
