an RSA encryption algorithm based on Chebyshev polynomials. 2 Diffie-Hellman Key Agreement with Chebyshev polynomials We generalize the Diffie-Hellman key agreement protocol as follows. Instead of generalizing the basic rule of exponents $(gm)^n = gmn = (gn)^m$ to an arbitrary group, we consider it as a polynomial identity $(xm)^n = xmn =$

Encryption algorithm based on Chebyshev polynomials over finite fields Recently, a public-key encryption algorithm based on Chebyshev polynomials over prime finite fields was proposed [6]. In addition to the semigroup property, the pseudo-randomness of these polynomials is an attractive feature for cryptographical purposes.

Let $n \in \mathbb{Z}$ and $x \in \mathbb{R}$; we define Chebyshev polynomial: $T_n(x)$ as $T_n(x) = \cos(n \arccos(x))$. Its semigroup property is as follows: In 2008, Zhang extended to the interval $(-1, 1)$. Therefore, we have a different formula of Chebyshev polynomial as follows: where $p \in \mathbb{Z}$, $x \in \mathbb{R}$ and $n \in \mathbb{Z}$. We see that can be changed to. 2.2. The Hard Problems

asymmetric cryptosystem that allows secure communication. Such a cryptosystem uses the fact that these polynomials form a semi-group due to the composition operation. This article presents new cryptosystems that use other than semi-group property dependencies. Based on these dependencies as well as modifications of Chebyshev's polynomials, two cryptosystems have been proposed.

When Chebyshev nodes are used, the maximum error is guaranteed to diminish with increasing polynomial order. The Remez Algorithm § The Chebyshev nodes are pretty good as far as minimising approximation error.

Practical Cryptography

In this paper, we make cryptanalysis on an image encryption based on Chebyshev chaotic map and find the following: (1) chosen-plaintext attack can break the scheme. (2) There exist equivalent keys and weak keys for the encryption scheme. (3) The scheme has low sensitivity to the changes of plain image.
