Fats Fatty Acids

Crystallization and polymorphism of fats and fatty acids

The molecular species of the fats and lipids are paraffins, fatty acids, glycerols (mono, di and trio), phospholipids, etc., which are categorized as long-chain compounds

Bookmark File PDF

(Small, 1986). The crystallization behaviour of fats and lipids has two major industrial implications: (a) processing of the end products made of fat crystals, such as chocolate, margarine and shortening, whipping cream, etc., and (b) separation of specific fats and lipids materials from natural resources.

The crystallization of fats is complicated not just by polymorphism, but also because it usually occurs from a multi-component melt rather than from a solvent which is more common in other industrial crystallizations.

Bookmark File PDF

This renders the conventional treatment of crystallization as a result of supersaturation somewhat meaningless.

Thermodynamic and kinetic aspects of fat crystallization

Polymorphism of Fats.
Solidified fats often exhibit polymorphism, i.e., they can exist in several different crystalline forms, depending on the manner in which the molecules orient themselves in the solid state.

Abstract. This work was aimed to study the solvent fraction of coconut oil (CNO). The fatty acid and triacylglycerol compositions, solid fat content (SFC) and the crystallization properties of CNO and its solid and liquid fractions obtained from fractionation at different conditions were

Bookmark File PDF

investigated using various techniques. CNO was dissolved in acetone (1:1 w/v) and left to crystallize isothermally at 10 ° C for 0.5, 1 and 2 h and at 12 ° C for 2, 3 and 6 h.
