The cylindrical Kadomtsev-Petviashvili equation (CKP) is a two-dimensional generalization of the cylindrical Korteweg-de Vries equation (CKdV). Johnson introduced the CKP equation in 1978 in the context of describing surface waves in a shallow incompressible fluid.

Abstract. We review results on the cylindrical Kadomtsev-Petviashvili (CKP) equation, also known as the Johnson equation. The presentation is based on our results. In particular, we show that the Lax pairs corresponding to the KP and the CKP equations are gauge equivalent. We also describe some important classes of solutions obtained using the Darboux transformation approach.

In mathematics and physics, the Kadomtsev–Petviashvili equation – or KP equation, named after Boris Borisovich Kadomtsev and Vladimir Iosifovich Petviashvili – is a partial differential equation to describe nonlinear wave motion. The KP equation is usually written as: $\partial_x + \lambda \partial_{yy} u = 0$ where $\lambda = \pm 1$. The above form shows that the KP equation is a generalization to two spatial ...

The decay mode solutions for the cylindrical KP equation

Abstract. The hydrodynamic equations of positive and negative ions, Boltzmann electron density distribution and Poisson equation with stationary dust particles are used along with the reductive perturbation method to derive a three-dimensional cylindrical Kadomtsev–Petviashvili equation. The generalized expansion method, used to obtain a new class of solutions, admits a train of well-separated bell-shaped periodic pulses.
