Double Acting Stirling Engine Modeling

A three phase free piston type double acting Stirling engine model is proposed and validated using experimental results. The modeling strategy is based on a combination of two sub-models: a global thermal model of the engine to deal with heat sources coupling and a detailed equivalent electrical network model which accounts for the gas and mechanical dynamic physics of the engine.

A double-acting hydraulic cylinder has a port at each end, supplied with hydraulic fluid for both the retraction and extension of the piston. A double-acting cylinder is used where an external force is not available to retract the piston or it can be used where high force is required in both directions of

mechanism applies to the four-cylinder double acting engine transmission, which can be extended to 8-cylinder and 12-cylinder engines. Fig. 1 shows the transmission mechanism of four-cylinder double-acting Stirling engine. As shown in Fig.1, the piston rod of No. 1 cylinder is in the upper dead point, and the crank angle is 0° .

The rotary Stirling engine seeks to convert power from the Stirling cycle directly into torque, similar to the rotary combustion engine. No practical engine has yet been built but a number of concepts, models and patents have been produced, such as the Quasiturbine engine. A hybrid between piston and rotary configuration is a double acting engine.

Design of the flat double-acting Stirling engine solves the drive of a displacer with the help of the fact that areas of the hot and cold pistons of the displacer are different. The drive does so without any mechanical transmission . Using diaphragms eliminates friction and need for lubricants.
