Entropy In Urban And Regional

Entropy in Urban and Regional Modelling introduced a new framework for constructing spatial interaction and associated location models. These ideas are reviewed briefly and then set in the wider context of the application of entropy in a range of disciplines. Related developments since 1970 are examined with particular reference to extensions of the core model, links to mathematical programming, the relationship to economics, and the introduction of a dynamic spatial structure hypothesis.

Introduction Entropy in Urban and Regional Modelling was published in 1970 as the culmination of 4 years of work in developing the idea and its applications (Wilson 1967). The original stimulus came from observing that the factors applied by American engineers to the gravity model had a resemblance to, but were not identical to, the partition functions used in statistical mechanics.
