The editor prefaces this third edition with reference to the continued cost effectiveness of clinical evoked potential investigations and to the impact of structural and functional imaging. The latter has served to focus the clinical application of evoked potentials, which still provide a temporal resolution greater than modern imaging ...

The use of evoked potentials in neurophysiological monitoring was discussed in the first edition (of which Chiappa was the single author) but not in the second edition. The topic is introduced again in this third edition, with four chapters that cover the use of evoked potentials in intraoperative monitoring in general and in specific operations and systems.

The visual evoked potential (VEP) is primarily a relatively large, positive polarity wave generated in the occipital cortex in response to visual stimulation. It measures the conduction time of neuronal activity from the retina to the occipital cortex and is used clinically as a measure of the integrity and function of that pathway.
