An interference filter or dichroic filter is an optical filter that reflects one or more spectral bands or lines and transmits others, while maintaining a nearly zero coefficient of absorption for all wavelengths of interest. An interference filter may be high-pass, low-pass, bandpass, or band-rejection.. An interference filter consists of multiple thin layers of dielectric material having ...

We show how these higher-order terms can be formulated such that filter-based inference remains possible. We demonstrate our techniques on joint stereo and object labelling problems, as well as object class segmentation, showing in addition for joint object-stereo labelling how our method provides an efficient approach to inference in product label-spaces.

Filter Based Mean Field Inference For Random Fields With  
Mean-field variational inference is one of the most popular approaches to inference in discrete random fields. Standard mean-field optimization is based on coordinate descent and in many situations can be impractical. Thus, in practice, various parallel techniques are used, which either rely

Approximate Inference: Mean Field Methods  
6 Lecture 13 : Variational Inference: Mean Field Approximation To wrap up, we first need a family of approximations called mean field approximations, in which there are no dependencies between latent variables (and also a generalized version of this). Then we decomposed the ELBO into a nice form under mean field assumptions.

1 Problem Setup  
Particle filters or Sequential Monte Carlo (SMC) methods are a set of Monte Carlo algorithms used to solve filtering problems arising in signal processing and Bayesian statistical inference. The filtering problem consists of estimating the internal states in dynamical systems when partial observations are made, and random perturbations are present in the sensors as well as in the dynamical system.

VASER augments the RNNs based SBR models with stochastic latent variables trained by both stochastic and amortized variational inference, enabling stable and effective approximate inference of a high-level "objective" of an entire session from the observed clicks. By modeling and quantifying the stochastic latent variables in sessions, VASER is expected to discover and disentangle causal ...
