Judging Dips from Geological Maps: The Earth's surface to a first approximation is a horizontal plane. A bed of rock, a dyke, a sill or a thick mineral vein is also a planar object. Where 2 non-parallel planes intersect they make a single line.

The top of a block diagram is an oblique view of the earth's surface, in other words it is a geologic map that you are viewing at an angle from above. The vertical sides of a block diagram are cross-sections, cut-away views that show how the rocks and structures extend into the earth. Cross-sections

Geologic maps show the distribution of the various igneous, sedimentary, and metamorphic rocks at Earth's surface in plan view. The contacts between different geologic formations and the various structures that occur in the rocks are typically superimposed upon the contour lines of topography in the map area. Geologic cross sections often appear with geologic maps. They are diagrams illustrating

Block diagrams are images based on three-dimensional (3-D) block models, which are blocks of wood or paper with geological structures marked on them. Block models and block diagrams assist in visualizing how 3-D geological structures in the real world can be represented in two dimensions on a map or in a geological cross-section.
