Adult Improving Access to Psychological Therapies programme; Workforce; Workforce. The Improving Access to Psychological Therapies (IAPT) workforce consists mainly of therapists working to deliver NICE-recommended high and low intensity interventions for people with mild, moderate and severe depression and anxiety disorders in a system of stepped care.

NHS England » Workforce

Adult Improving Access to Psychological Therapies programme. The Improving Access to Psychological Therapies (IAPT) programme began in 2008 and has transformed the treatment of adult anxiety disorders and depression in England. IAPT is widely-recognised as the most ambitious programme of talking therapies in the world and in the past year alone more than one million people accessed IAPT services for help to overcome their depression and anxiety, and better manage their mental health.

Adult Improving Access to Psychological Therapies programme

Improving Access to Psychological Therapies (IAPT) services provide evidence-based psychological therapies to people with anxiety disorders and depression. We assessed digitally enabled therapies for anxiety, depression and medically unexplained symptoms which offer the potential to expand these services further.

Improving Access to Psychological Therapies (IAPT) | NICE ...

In England, the Improving Access to Psychological Therapies (IAPT) programme (Department of Health 2008) aims to greatly increase the number of people treated using evidence-based approaches (as defined by the National Institute for Health and Clinical Excellence, NICE)

for depression and anxiety disorders in primary care. The potential economies of scale afforded by the use of group work will be an attractive proposition for National Health Service providers working to implement IAPT.

To evaluate the effectiveness of group Cognitive Behaviour Therapy (CBT) based on the work of Fennell in treating low self-esteem 50 participants attended a 10-week group programme. Pre- and post-group measures of depression, anxiety and self-esteem were compared using Mann-Whitney U tests. The results indicated that there was a statistically significant and clinically meaningful change across all pre- and post-group measures.
