The quartz sand with an average particle size of 3.588 μm exhibited an excellent sorption performance for the removal of aqueous U (VI) ions at pH 5.0. The sorption rate increased as the dosage of sorbent increased. The sorption rate descends with the rise of the initial U (VI) concentration while its sorption amount is reversed.

The influence of particle size and natural organic matter ...

With regard to the particle size it is generally the low sized powders (that have large amount of air gaps if multilayered in the DSC pan) that are prone to the influence by the overall systematic thermal conductivity. On the other hand, the larger particles can suffer from the delayed heat transfer with the particles themselves.

Influence of particle size and manufacturing conditions on ...

The influence of particle size on the degradation is attributed to the fact that in smaller particles degradation products formed within the particle can diffuse easily to the surface while in the larger particles degradation products have a longer path to the surface of the particle.

Influence of particle size and dissolution conditions on ...

This laboratory study examined the influence of particle size and density, and channel velocity on the spatial deposition pattern around an emergent (extending through the entire water depth), circular patch of model vegetation located at the center of a channel.

Influence of particle size and density, and channel ...

Our computational and experimental studies provide a simultaneous analysis of different particle sizes and shapes for their retention in blood flow and indicate that in presence of RBCs, micro-scale non-spherical particles undergo enhanced 'margination + adhesion' compared to nano-scale spherical particles, resulting in their higher binding. These results provide important insight regarding improved design of vascularly targeted drug delivery systems.

The empirical approach proposed by Rahman and Lo (2008) considers the effect of particle size through $\chi = D_{10} / d_{50}$, defined as the ratio of the size of sand at 10% finer (D_{10}) and the size of fines at 50% finer (d_{50}) respectively: $f_{thr} = A / (1 + \exp(\alpha - \beta \chi))$ where $A = 0.40$ is an asymptotic value of f_{thr} when $1 / \chi$ tends to zero.

The actual phase transition path can be affected by particle size and cycling rate. In this study, we investigated the phase transition process during the electrochemical Li intercalation of anatase TiO₂ as a function of particle size (25 nm and 100 nm), cycling rate (1C, 2C, 5C, 10C, 20C) and temperature (room temperature and 80 °C) by in situ synchrotron X-ray diffraction.

Influence of particle size, cycling rate and temperature ...

The effects of particle size on gas production were similar to those found when incubations were carried out with rumen digesta. Per g FP the rate was 40% lower with 1-2 mm than with 0.1-0.4 mm particles. However, per m² surface area the rate was found to be approximately 450% greater with the former.

Influence of particle size and surface area on in vitro ...

The particle size distribution and particle concentration had distinct influence on the coagulation mechanisms. Under neutral conditions, as the amount of coagulant increased, the coagulation mechanism for nanoparticles changed from charge neutralization to sweep flocculation and the nanoparticles became destabilized, re-stabilized and again destabilized.

The influence of particle size and concentration combined ...

Chromatographic efficiency is inversely proportional to particle size according to the following general relationship: Where L is the column length and d_p the particle diameter. Therefore, changing from a $5\mu\text{m}$ to $3\mu\text{m}$ particle and keeping all other factors constant will produce an increase of 20 -25% in efficiency and subsequently increase ...

The aim of this work was to study the influence of particle size on lipid digestion and β -carotene bioaccessibility using corn oil-in-water emulsions with different initial droplet diameters: large ($d_{43} \approx 23 \mu\text{m}$); medium ($d_{43} \approx 0.4 \mu\text{m}$); and small ($d_{43} \approx 0.2 \mu\text{m}$). There was a progressive increase in the mean particle size of all the emulsions as they passed through a simulated gastrointestinal tract (GIT) consisting of mouth, stomach, and small intestine phases, which was ...

Williams and Houlihan [13] showed that surface roughness, particle size, type and composition and the water content are the major parameters that can influence the interface shear behavior of soil-geomembrane.

Particle size affected flour and bread-baking properties of pulse flours indicating that particle size should be considered when formulating pulse-based breads. Flours milled from whole pulses will have larger particle size distributions due to the presence of hull.

The dominant influence of surfactants, additives, particles size and shape on the surface plasmon resonance (SPR) was found. SPR is considerably sensitive to the dielectric environment in addition to size and shape.

The influence of the concentration and the size of WC/W 2 C carbides on the wear resistance of laser cladded MMC coatings is dependent on the wear mode. Ball-on-disc tests with sliding of a Al_2O_3 ball against the laser clad coatings show that an increase in concentration of the carbides as well as a decrease in their size are both favourable for the wear resistance.
