By Jestine Yong on October 28, 2007 What if you do not know how to use voltage and signal testing on a faulty board? Of course it is a great advantage to know both of the repair techniques but sometimes without using them we still can repair electronic equipment. What you need to do is first diagnose the problem and find out the faulty circuit.

By Jestine Yong on April 19, 2010. A leaky or shorted internal diode in the flyback transformer of a CRT TV or Monitor would cause the set to shutdown upon power on, power blink and even blowing some of the corresponding components like the HOT, B+ FET and B+ coil. Usually if the diode have a direct short circuit it will be easily detect by checking the connection between the anode and the ABL line using analog meter set to X 10 K ohm range.

I use Jestine Yong's directions in testing semiconductor testing. He always advised to test it in x1 range and repeat the test in x10 range also, as both ranges use different voltages. I have found these to be very, very useful and more accurate than even the Peak Atlas. I have mentioned this in one of my previous articles!
