Synopsis. This book is an introduction to the remarkable work of Vaughan Jones and Victor Vassiliev on knot and link invariants and its recent modifications and generalizations, including a mathematical treatment of Jones-Witten invariants. It emphasizes the geometric aspects of the theory and treats topics such as braids, homeomorphisms of surfaces, surgery of 3-manifolds (Kirby calculus), and branched coverings.

Knots, Links, Braids A knot is a simple closed curve (homeomorphic image of  $S^1$ ) in Euclidean 3-space  $E^3$ . Two knots are called equivalent when there is an orientation-preserving homeomorphism of  $E^3$  onto itself sending one knot to the other.

Knots, Links and Braids 2.1 Knots and Links A knot  $K$  is a smooth or piecewise linear embedding of a closed curve in a 3-dimensional manifold. Usually, the manifold of choice is either  $\mathbb{R}^3$  or  $S^3$ , so that the knot  $K$  may be denoted  $S^1, \mathbb{R}^3 \hat{=} S^3$ : While it is important to remember that we are dealing with curves in 3-

knots and links. Closed 8-braid vs closed 3-braid for type (5,3) torus knot. Some special properties of Lorenz knots and links [B-W, 1983]: All Lorenz links are prime, and are braidable. Link genus determined combinatorially.  $2g = c_n + 2$ . Braid index is too. If  $W = \prod_{i=1}^n (R_{n_i} \cdot L_{m_i})$ , then  $t = \text{braid index}$ .

In mathematical knot theory, a link is a collection of knots which do not intersect, but which may be linked (or knotted) together. A knot can be described as a link with one component. Links and knots are studied in a branch of mathematics called knot theory. Implicit in this definition is that there is a trivial reference link, usually called the unlink, but the word is also sometimes used in ...

A trivial link would have 125 Fox 5-colorings (one for each choice of color for each of the three links), but the Borromean rings have only five. Number theory. In arithmetic topology, there is an analogy between knots and prime numbers in which one considers links between primes.

alternating, hyperbolic, fibered, prime, fully amphichiral. In knot theory, the  $6_3$  knot is one of three prime knots with crossing number six, the others being the stevedore knot and the  $6_2$  knot. It is alternating, hyperbolic, and fully amphichiral . It can be written as the braid word.

The Berkley Braid Knot . Fold over the end of the line so you have 5-6 inches of doubled line, making a loop. Thread the end of the doubled line loop through the eye. Squeeze the end of the loop to form a point, this'll make this step much easier; Wrap the loop around the tag-end and the mainline 8 times. Start from the top and wrap towards the eye.

In knot theory, the trefoil is the first nontrivial knot, and is the only knot with crossing number three. It is a prime knot, and is listed as  $3_1$  in the Alexander–Briggs notation. The Dowker notation for the trefoil is  $4_6 2$ , and the Conway notation is  $[3]$ . The trefoil can be described as the  $(2,3)$ -torus knot.

The knot complement of the Hopf link is  $\mathbb{R} \times S^1 \times S^1$ , the cylinder over a torus. This space has a locally Euclidean geometry, so the Hopf link is not a hyperbolic link. The knot group of the Hopf link (the fundamental group of its complement) is  $\mathbb{Z}^2$  (the free abelian group on two generators), distinguishing it from an unlinked pair of loops which has the free group on two generators as ...
