1.1.3 Advise pregnant women with more than 1 moderate risk factor for pre-eclampsia to take 75–150 mg of aspirin [1] daily from 12 weeks until the birth of the baby. Factors indicating moderate risk are:

Recommendations | Hypertension in pregnancy: diagnosis and ...

Daily low-dose aspirin makes the blood less sticky and helps to prevent heart attacks and stroke. It's usual to take a dose of 75mg once a day. Sometimes doses may be higher. It's best to take low-dose aspirin with food so it doesn't upset your stomach.

Aspirin: low dose to prevent heart attacks and stroke - NHS

Low dose aspirin started before 16 weeks gestation and calcium supplementation after 20 weeks gestation in low-intake populations can prevent the onset of pre-eclampsia in pregnancies at risk of the condition, states a new review published today in The Obstetrician & Gynaecologist (TOG). It is also possible to assess a woman's risk of developing pre-eclampsia from as early as 11 weeks of pregnancy, say the authors.

TOG release: Low dose aspirin and calcium supplementation ...

The daily recommended aspirin dosage for at-risk pregnant women is 81mg, about a quarter of the amount you might take in a single dose used for pain relief. For preeclampsia prevention, ACOG recommends starting the dosage during the second trimester. Research shows this low dosage poses little risk to you or your baby.
