I have a problem with this exercise given by the professor for home. It's about Lyapunov equation and autonomous systems. Here it is: Prove that if the state of equilibrium $x^*=0$ ($x^* \in \mathbb{R}^n$) of the system: $x(k+1)=e^A x(k)$ with $A \in \mathbb{R}^{(n \times n)}$ is asymptotically stable then even the equilibrium state $x^{**}=0$ of the system: $\dot{x} = Ax(t)$ is asymptotically stable.

Abstract. Finite-time stability involves dynamical systems whose trajectories converge to a Lyapunov stable equilibrium state in finite time. In this paper, we address finite time stability of discrete-time dynamical systems. Specifically, we show that finite time stability leads to uniqueness of solutions in forward time.

to prove stability of origin for $\dot{x} = -a(t)x$ Because your system has time varying parameters. It is autonomous, and time varying. What you need to do is to construct a time varying Lyapunov function, and in the process you will encounter when a Lyapunov function is said to be descreascent, etc. Those are not a part of the classical Lyapunov theory, which deals with time-invariant, autonomous system.

The book subsequently establishes a framework for non-autonomous dynamical systems, and in particular describes the various approaches currently available for analysing the long-term behaviour of non-autonomous problems. Here, the major focus is on the novel theory of pullback attractors, which is still under development.

Lyapunov Stability • Definition: The equilibrium state $x = 0$ of autonomous nonlinear dynamic system is said to be stable if: • Lyapunov Stability means that the system trajectory can be kept arbitrary close to the origin by starting sufficiently close to it $\forall \epsilon > 0, \exists \delta > 0, \{0 < r < \delta \mid \forall t \geq 0, x(t) < \epsilon\} \implies x(0) < r$ Stable Unstable

In dynamical systems, an orbit is called Lyapunov stable if the forward orbit of any point is in a small enough neighborhood or it stays in a small (but perhaps, larger) neighborhood. Various criteria have been developed to prove stability or instability of an orbit.

Finite time stability is defined for continuous non autonomous systems. Starting with a result from Haimo Haimo (1986) we then extend this result to n - dimensional non autonomous systems through the use of smooth and nonsmooth Lyapunov functions as in Perruquetti and Drakunov (2000).
