We provide a rigorous derivation of the Ensemble Kalman-Bucy Filter as well as the Ensemble Transform Kalman-Bucy Filter in case of nonlinear, unbounded model and observation operators. We identify them as the continuous time limit of the discrete-time Ensemble Kalman Filter and the Ensemble Square Root Filters, respectively, together with concrete convergence rates in terms of the ...

A novel, transfer-function solution of the Kalman-Bucy time-invariant filtering problem is presented. It is assumed that both message model and noise intensities are time invariant and that the mixture of message and noise has been observed over an infinite interval. This transfer-function approach is based on matrix fractions and spectral factorization of polynomial matrices.

The Kalman filter keeps track of the estimated state of the system and the variance or uncertainty of the estimate. The estimate is updated using a state transition model and measurements.  $\hat{x}_k$  – denotes the estimate of the system's state at time step  $k$  before the  $k$ -th measurement  $y_k$  has been taken into account;  $\Sigma_k$  – is the corresponding uncertainty.

Confining attention to the Kalman-Bucy filter, the mathematics needed consists mainly of operations in Hilbert spaces. A relatively complete treatment of mean square calculus is given, leading to a discussion of the Wiener-Levy process. This is followed by a treatment of the stochastic differential equations central to the modeling of the Kalman-Bucy filtering process.

It is well-known that Kalman and Bucy (1961) built the fundamental results of the filtering problem for linear Gaussian systems, which are the foundation of modern filtering theory (see Bensoussan, 2004, Liptser and Shiryaev, 2013). Therefore, the filtering theory can be applied to study stochastic optimal control problems with partial ...
