Until now, only few studies have been conducted to determine the functional neuroanatomical correlates of aesthetic experience in visual arts, though various behavioral studies have been concerned with the perception of artworks and style-related aspects of processing (e.g., Belke et al., 2006, Cupchik et al., 1994, Locher, 2003, Vartanian et al., 2005). At the same time, aesthetics have had a long tradition as an empirical discipline, with the heyday in the beginning of the 19th century.

**Functional neuroanatomy of the perception of modern art: A ...**

neural correlates of aesthetic preference is directly grounded on visual neuroscience, which makes it an ideal candidate to bridge this gap. Chatterjee (2003) suggested that aesthetic preference involves three processing stages, common to the perception of any visual stimulus.

**Towards a framework for the study of the neural correlates ...**

In particular, the aesthetic preference expressed for the paintings in the Compatible condition (4.974 ± 0.181; Mean ± s.e.m.) was significantly higher (p = 0.048, Newman-Keuls post-hoc test) than that in the Incompatible condition (4.877 ± 0.168), and marginally different (p = 0.067) from that in the Control condition (4.899 ± 0.176; Figure Figure2B). 2B).

Neuroesthetics is a relatively recent sub-discipline of empirical aesthetics. Empirical aesthetics takes a scientific approach to the study of aesthetic perceptions of art, music, or any object that can give rise to aesthetic judgments. Neuroesthetics received its formal definition in 2002 as the scientific study of the neural bases for the contemplation and creation of a work of art. Neuroesthetics uses neuroscience to explain and understand the aesthetic experiences at the neurological level.

**Neuroesthetics - Wikipedia**

Another possible explanation for laypeople's greater preference for representational over abstract art is that esthetic processing is based on the appraisal of valence of objects, a general cognitive process that applies to both non-art and art objects (Brown et al., 2011). Therefore, affectively meaningful objects in representational paintings are preferred over [meaningless] colors and forms.

Women scored higher than men on the centrality of visual product aesthetics (CVPA). We examined the association between the CVPA and gray matter volume (GMV). Women's CVPA was positively correlated to GMV in the left mOFC and dorsal striatum. Men's CVPA scores were negatively correlated with GMV in the left mOFC.
