Operations On Fuzzy Sets Logical

A fuzzy set operation is an operation on fuzzy sets. These operations are generalization of crisp set operations. There is more than one possible generalization.

The most widely used operations are called standard fuzzy set operations. There are three operations: fuzzy complements, fuzzy intersections, and fuzzy unions

membership functions. Each fuzzy set is a representation of a linguistic variable that defines the possible state of output.

Membership function is the function of a generic value in a fuzzy set, such that both the generic value and the fuzzy set belong to a universal set. The degrees of membership of that generic value in the fuzzy set

A fuzzy set  $A$  in the universe of information  $U$  can be defined as a set of ordered pairs and it can be represented mathematically as  $A = \{ (y, \mu_A(y)) \mid y \in U \}$ . Here  $\mu_A(y)$  = degree of membership of  $y$  in  $A$ , assumes values in the range from 0 to 1, i.e.,  $\mu_A(y) \in [0, 1]$ .

fuzzy logical reasoning is the fact that it is a superset of standard Boolean logic. In other words, if you keep the fuzzy values at their extremes of 1 (completely true), and 0 (completely false), standard logical operations will hold. As an example, consider the following standard truth tables.
