First, paper roll properties allow winding to extremely large-diameter build-up ratios, where the final roll's diameter may be 20x the core diameter. If tensioning torque is generated from the roll's center — the definition of center winding — the torque required (tension \times radius) will have a torque range impossible for most motors.

This paper extends the winding function theory for nonuniform air gap in rotating electric machinery. It shows that the winding function for nonuniform air gap differs with that used in the symmetrical case, while several papers employ the uniform air-gap winding function in order to study the electric motors performance.
