Pregnancy tests are designed to tell if your urine or blood contains a hormone called human chorionic gonadotropin (hCG). When the egg and sperm fuse together (fertilisation), they make a new cell from their genetic material. This cell divides, each time creating new cells. These cells multiply until they finally make an embryo.

Pregnancy Tests Explained - Window to the Womb

If ultrasonography is needed during the 1st trimester (eg, to evaluate pain, bleeding, or viability of pregnancy), use of an endovaginal transducer maximizes diagnostic accuracy; evidence of an intrauterine pregnancy (gestational sac or fetal pole) can be seen as early as 4 to 5 weeks and is seen at 7 to 8 weeks in > 95% of cases. With real-time ultrasonography, fetal movements and heart motion can be directly observed as early as 5 to 6 weeks.
