Soil sampling for spatially explicit management There are two main methods for soil sampling in spatially explicit management — zone-based sampling and grid sampling. With each method, soil samples are collected from predefined areas in a field. By correlating the soil test results with the area of the Figure 3.

The sampling technique used is known as grid-point sampling. A grid-point sample consists of at least 10 cores collected from a small area (10-foot radius) around a geo-referenced point. When using a grid sampling approach, Wisconsin research recommends a sampling strategy based on an unaligned systematic grid (Figure 2).

Soil sampling is the best way to determine the soil pH and level of residual nutrients. It is often beneficial to establish a base level of residual nutrients in the soil over time. The ability to make sound fertility decisions are enhanced when producers apply best available sampling techniques for nitrogen, phosphorus, potassium and trace elements.

Both grid and directed soil sampling are valid options for precision soil sampling. Grid sampling for nitrate-N is not recommended because annual fluctuations in nitrate levels would require annual grid sampling, which is not cost-effective. Instead, residual nitrate sampling (to a depth of 3 feet) should be done on a directed sampling basis.
