Static regain - Method for Duct Design. Whenever there is an enlargement in the cross-sectional area of the duct, the velocity of air decreases, and the velocity pressure is converted into static pressure. The increase in static pressure due to a decrease in velocity pressure is known as static regain. In an ideal case, when there are no pressure losses, the increase in static pressure (ps) is exactly equal to the decrease in velocity pressure (pv) and the total pressure (pt) remains ...

What is Static Regain? This design methodology sizes the supply duct system to obtain uniform static pressure at all branches and outlets. Much more complex than equal friction, static regain can be used to design systems of any pressure or velocity. Duct velocities are systematically reduced over the length of the distribution layout, which allows the velocity pressure to convert to static pressure, offsetting friction losses in the succeeding section of duct.

What is Static Regain? - StaticRegain.net

Static regain is the third sizing method for ductwork included in Design Master HVAC. It is most often used in the high pressure ductwork between the main AHU and the VAV boxes. The calculation works by keeping the static pressure in the ductwork constant throughout the system. The air velocity is decreased so that the velocity pressure drop matches the total pressure drop in the system. Sizing ductwork using the static regain method results in small ducts and a system that is nearly ...

Duct velocities are systematically reduced over the length of the distribution layout, which allows the velocity pressure to convert to static pressure, offsetting friction losses in the succeeding section of duct.

Tsal developed a life-cycle cost-based duct design method called the T-method. 6. in the 1980s, but its simplified techniques for calculating both first costs and energy costs were deemed to be so inaccurate, the T-method was removed from Chapter 21 in 2013. Instead, Chapter 21 lists two duct sizing methods: Equal Friction (EF).

VAV System Duct Main Design - Taylor Engineering

Static Regain Sizing Method For this method, a section of the duct system is sized so that the increase in static pressure due to velocity reduction from its upstream section, offsets the friction loss in the section. As in the other sizing methods, the program starts sizing with the first section.

Methods of ductwork design. There are many different methods used to design ventilation systems, the most common ways being: Velocity reduction method: (Residential or small commercial installations) Equal friction method: (Medium to large sized commercial installations) Static regain: Very large installations (concert halls, airports and industrial)

The Static Regain method is widely used by practising HVACn2engineers. Most duct design software packages incorporate this method and it is described in virtually every duct design text book 2, 3, 4, 5, 6, 7, 8, 9, 10. Conceptually it is easy to understand and the calculations can be done by hand.

The Static Regain method of duct sizing is based on Bernoulli's equation, which states that when a reduction of velocities takes place, a conversion of dynamic pressure into static pressure occurs.

Existing Duct Sizing Methods - Lawrence Berkeley National ...

The basic principle of the static regain method is to size a duct run so that the increase in static pressure at each take off just offsets the loss due to friction in the succeeding section of duct. Static regain the air remains constant as it travels through a diverging section of duct from A to B. Now P total = P static + P velocity.

The equal friction method for sizing air ducts is often preferred because it is quite easy to use. The method can be summarized to. Compute the necessary air volume flow (m³ /s, cfm) in every room and branch of the system; Use 1) to compute the total air volume (m³ /s, cfm) in the main system; Determine the maximum acceptable airflow velocity in the main duct

Duct Sizing - Equal Friction Method

Uni-Duct software employs the static regain design method enhanced by the total pressure method to design efficient supply systems. It creates static regain designs, analyzes pressure requirements, and determines a system's design leg or critical path (path of maximum static pressure requirement).
