Flow System Models. A flow system model shows the orderly flow of the material, energy, and information that hold the system together. Program Evaluation and Review Technique (PERT), for example, is used to abstract a real world system in model form. Static System Models. They represent one pair of relationships such as activity – time or cost – quantity.

We call attention to three considerations for modeling natural gas-related methane emissions in life cycle assessment (LCA). First, natural gas system methane leakage is inconsistently characterized and likely systematically underestimated by commonly used life cycle inventory (LCI) databases.

In aquatic systems modeling, under the framework of dynamical systems (Wiggins, 2005), some interactively coupled Eulerian – Lagrangian models have been designed during the last decade (Hermann et al., 2001, Goodwin et al., 2006). Typically, in these models, hydrodynamical processes are described using PDEs, while biological components (e.g. zooplanktons or phytoplanktons) are represented by a Lagrangian approach allowing to simulate individual organisms.
