This study focuses on proposing a robust topology optimization method of PnC microstructures against random diffuse regions between material phases. The material distribution of the unit cell is performed using the phase-field method, which is able to simulate the motion and the uncertain width of the diffuse regions.

Topology optimization (TO) is a mathematical method that optimizes material layout within a given design space, for a given set of loads, boundary conditions and constraints with the goal of maximizing the performance of the system. TO is different from shape optimization and sizing optimization in the sense that the design can attain any shape within the design space, instead of dealing with predefined configurations. The conventional TO formulation uses a finite element method (FEM) to evaluat
