These genes were typically expressed from strong constitutive promoters (those that are always turned on), such as from plant viruses (especially the cauliflower mosaic virus 35S promoter) (Fang et al. 1989). These genes did not require intricate, multiple connections with plant genes or plant proteins to function.

On Tuesday, June 5, UCS released a report, “High and Dry,” that analyzes the prospects of genetic engineering to reduce crop losses to drought, and to develop crops that use less water. How we deal with losses from drought—the single largest cause of crop loss—and the growing and unsustainable demand for clean fresh water, of which agriculture uses the largest share, are important questions for the coming century.
