~~WebSphere Application Server Administration Using Jython ...~~

The IBM HTTP Server installation includes the administration server, which installs by default during a typical IBM HTTP Server installation. The administration server is the interface that handles requests between the administrative console and the remote IBM HTTP Server defined on the unmanaged node. The administration server must be started by a root user and defined to an unmanaged WebSphere Application Server node.

~~WebSphere Application Server administrative console~~

The WebSphere Application Server administration console includes header information and arguments when issuing HTTP requests to the IBM Administration Server. If you do issue http://hostname:8008/wasadmin you will received an Authentication prompt but even if the user and password are correct the request will fail.

WebSphere has the ability to have multiple application server definitions using the same underlying base binaries. Each profile defines the attributes and configurations for a given application server. Each standalone application server can optionally have its own administrative console application, which you use to manage the application server.
